Percocet is a prescription medication used for the management of **moderate to moderately severe pain**.

It is a **combination opioid analgesic** that contains two active ingredients:

1. **Oxycodone**: An opioid (narcotic) pain reliever that works in the brain to change how the body feels and responds to pain.
2. **Acetaminophen** (often known by the brand name Tylenol): A non-opioid pain reliever that also acts as a fever reducer and enhances the effect of the oxycodone.

⚠ Important Safety Information

Percocet is a strong medication with serious risks:

- **Controlled Substance**: Due to the oxycodone content, Percocet is classified as a **Schedule II controlled substance** in the United States, indicating a high potential for abuse, addiction, and severe psychological or physical dependence.
- **Overdose Risk**: Like all opioids, there is a risk of **life-threatening respiratory depression** (slowed or stopped breathing), overdose, and death, even at prescribed doses.
- **Liver Damage**: Because it contains acetaminophen, taking more than the maximum daily dose or using it with alcohol can cause **severe, potentially permanent liver damage (hepatotoxicity)**.

Common Side Effects

Common side effects of Percocet can include:

- Constipation
- Nausea and vomiting

- Dizziness or lightheadedness
- Drowsiness
- Headache
- Stomach pain

Always take Percocet exactly as prescribed by your healthcare provider, and never share this medication with anyone else.
